LABELLING OF INSULATING PRODUCTS

We have been considering the labelling of our products which contained calcined diatomaceous earth which are namely C-22 Brick, [redacted], C-3 Aggregate and Kaffrite and Mr. Sheckler has recommended the following label:

CAUTION - This product contains silica

1. Avoid breathing dust.
2. Keep dust to a minimum by use of proper controls.
3. Respirators or dust masks approved by the U.S. Bureau of Mines for silica dust are recommended.

I wish you would take the same procedure to have this label issued on finished product specifications the same way we did the asbestos dust label and if there are any questions, please see me.

I understand from our past experience that these labels should not be put on products that go to the Canadian and International Division and maybe you can check their Department to see if they object or if some special provision should be made.

It is my understanding that with these labels almost all our products will have labels on them.
